Functional principle

The opposed mode sensor incorporates an emitter and a receiver. The emitter emits light in the near IR range with a wavelength of 1450 nm, which approximates one of the absorption edges of water. The resulting high contrast ratio leads to a particularly high sensitivity with water or media containing water as opposed to transparent media. The receiver converts the light intensity to an analog output signal of 0...10 V, whereby 0 V indicates the continuous light beam and 10 V indicates the blocked light beam.
