# 1. About this document

#### 1.1 Function

This operating instructions manual provides all the information you need for the mounting, set-up and commissioning to ensure the safe operation and disassembly of the safety-monitoring module. The operating instructions must be available in a legible condition and a complete version in the vicinity of the device.

# 1.2 Target group: authorised qualified personnel

All operations described in this operating instructions manual must be carried out by trained specialist personnel, authorised by the plant operator only.

Please make sure that you have read and understood these operating instructions and that you know all applicable legislations regarding occupational safety and accident prevention prior to installation and putting the component into operation.

The machine builder must carefully select the harmonised standards to be complied with as well as other technical specifications for the selection, mounting and integration of the components.

# 1.3 Explanation of the symbols used

# Information, hint, note:

This symbol is used for identifying useful additional information.

**Caution:** Failure to comply with this warning notice could lead to failures or malfunctions.

**Warning:** Failure to comply with this warning notice could lead to physical injury and/or damage to the machine.

# SRB-E-204ST / SRB-E-204PE

#### 1.4 Appropriate use

The Schmersal range of products is not intended for private consumers.

The products described in these operating instructions are developed to execute safety-related functions as part of an entire plant or machine. It is the responsibility of the manufacturer of a machine or plant to ensure the correct functionality of the entire machine or plant.

The safety-monitoring module must be exclusively used in accordance with the versions listed below or for the applications authorised by the manufacturer. Detailed information regarding the range of applications can be found in the chapter "Product description".

#### 1.5 General safety instructions

The user must observe the safety instructions in this operating instructions manual, the country-specific installation standards as well as all prevailing safety regulations and accident prevention rules.

Further technical information can be found in the Schmersal catalogues or in the online catalogue on the Internet: products.schmersal.com.

The information contained in this operating instructions manual is provided without liability and is subject to technical modifications.

There are no residual risks, provided that the safety instructions as well as the instructions regarding mounting, commissioning, operation and maintenance are observed.

# 1.6 Warning about misuse

In case of inadequate or improper use or manipulations of the safety-monitoring module, personal hazards or damage to machinery or plant components cannot be excluded.

#### 1.7 Exclusion of liability

We shall accept no liability for damages and malfunctions resulting from defective mounting or failure to comply with this operating instructions manual. The manufacturer shall accept no liability for damages resulting from the use of unauthorised spare parts or accessories.

For safety reasons, invasive work on the device as well as arbitrary repairs, conversions and modifications to the device are strictly forbidden; the manufacturer shall accept no liability for damages resulting from such invasive work, arbitrary repairs, conversions and/or modifications to the device.

The safety relay module is to be operated in an area in which access by personnel is restricted.

#### 2. Product description

#### 2.1 Ordering code

This operating instructions manual applies to the following types:

SRB-E-204ST-① SRB-E-204PE-①

No.	Option	Description
1	СС	Plug-in screw clamps: single wire (rigid) or fine wire (flexible): 0.2 2.5 mm²; fine wire with ferrule: 0.25 2.5 mm² Plug-in cage clamps: single wire (rigid) or fine wire (flexible): 0.2 1.5 mm², fine wire with ferrule: 0.25 1.5 mm²

Only if the action described in these operating instructions is carried out correctly will the safety function be safeguarded, including compliance with the Machinery Directive.

#### 2.2 Special versions

For special versions, which are not listed in the order code below 2.1, these specifications apply accordingly, provided that they correspond to the standard version.

#### 2.3 Destination and use

The safety-monitoring modules for integration in safety circuits are designed for fitting in control cabinets. They are used for the safe evaluation of the signals of positive break position switches or safety sensors for safety functions on sliding, hinged and removable safety guards as well as emergency stop control devices, safety solenoid switches and AOPD's.

The safety function is defined as deactivating outputs Q1,Q2 when at least one of the inputs S12/S22, S32/S42, S52/S62 and S72/S82 are opened.

Taking account of a PFH value assessment, the safety-relevant current paths meet the following requirements (see also chapter 2.6 "Safety classification")

- Category 4 PL e to EN ISO 13849-1
- SIL 3 to IEC 61508

Safety outputs Q1 and Q2 of input extension SRB-E-204PE must be processed further by means of a fail-safe sequential circuit. Start and reset function as well as feedback circuit monitoring must be realised with the sequential circuit.

To determine the Performance Level (PL) to EN ISO 13849-1 of the entire safety function (e.g. sensor, logic, actuator), an assessment of all relevant components is required.

The entire concept of the control system in which the safety component is integrated, must be validated to the relevant standards.

# 2.4 Technical data

#### 2.5 Derating

No derating with individual installation of modules.

Derating on request if several modules are installed one after the other without spacing and with maximum output load and ambient temperatures.

## 2.6 Safety classification of semi-conductor output

Standards:	EN ISO 13849-1, IEC 61508
PL:	e
Category:	4
PFH <sub>D</sub> :	≤ 2.66 x 10 <sup>-9</sup> / h
PFD <sub>avg</sub> :	≤ 2.42 x 10 <sup>-5</sup>
SIL:	suitable for SIL 3 applications
Mission time:	20 years

## 3. Mounting

## 3.1 General mounting instructions

Mounting: snaps onto standard rails to EN 60715.

Hook bottom of enclosure in rail and push down until it engages in position.

#### 3.2 Dimensions

Device dimensions (H/W/D): 98 x 22.5 x 115 mm

# 4. Electrical connection

#### 4.1 General information for electrical connection

The electrical connection may only be carried out by authorised personnel in a de-energised condition.

If mains unit is a new installation or a replacement, the connector of the output level must be removed and correct connection of the power supply (A1) must be checked.

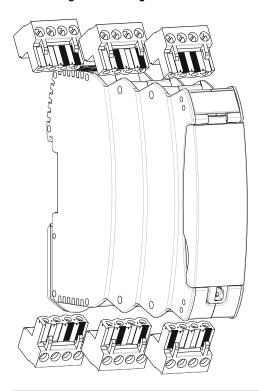

To avoid EMC disturbances, the physical ambient and operational conditions at the place where the product is installed, must meet the provisions laid down in the paragraph "Electromagnetic Compatibility (EMC)" of EN 60204-1.

# Settle length x of the conductor:

- on screw terminals: 7 mm
- on cage clamps of type s or f: 10 mm

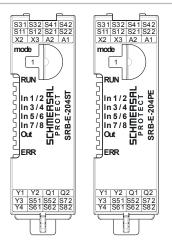

# 4.2 Coding of connecting terminals

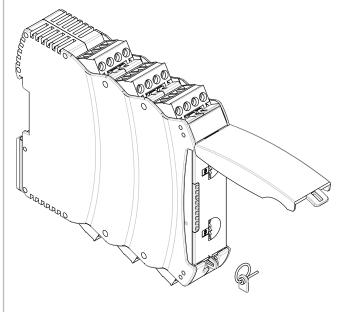

# 5. Operating principle and settings

# Adjustment of application using rotary "mode" switch

- Open front transparent cover (see fig.).
- Opening is carried out by lifting side with lock.
- Select desired application using rotary mode switch (1 ... 10) by turning up or down (see 5.3).
- After performing setting, close front cover again.
- Front cover can be secured with a lead seal to protect it from being opened unintentionally

Only touch the components after electrical discharge!

LED	Error cause	Long flash Short flash	
	Application changed and activation of operating voltage	LEDs flash quickly: RUN, In 1/2, In 3/4, In 5/6, In 7/8, Out	
ERR	Application was changed during active operation	LEDs flash quickly: ERR, In 1/2, In 3/4, In 5/6, In 7/8, Out	
	Other fault codes: Consult technical sales dept. at Schmersal		

# 7. Wiring examples

#### 7.1 Possible applications

All applications for 1 or 2-channel safe evaluation for protective equipment as follows:

- Safety door monitoring to EN ISO 14119
- Position switches with positive break to EN 60947-5-1
- Safety sensors to EN 60947-5-3
- Emergency stop command devices to EN ISO 13850 and EN 60947-5-5
- Magnetic safety sensors to EN 60947-5-3
- Safety light curtain and photoelectric barriers according to IEC 61496

The connection of magnetic safety switches to the SRB-E-... safety-monitoring module is only admitted when the requirements of the standard EN 60947-5-3 are observed.

As the technical data are regarded, the following minimum requirements must be met:

- Switching capacity: min. 240 mW
- Switching voltage: min. 24 VDC
- switching current: min. 10 mA

For example, the following safety sensors meet the requirements:

- BNS 36-02Z(G), BNS 36-02/01Z(G)
- BNS 260-02Z(G), BNS 260-02/01Z(G)

When sensors with LED are wired in the control circuit (protective circuit), the following rated operating voltage must be observed and respected:

• 24 VDC with a max. tolerance of -5%/+20%

Otherwise availability problems could occur, especially in series-wired sensors, where a voltage drop in the control circuit is triggered by LED's for instance.

# 7.2 Application example

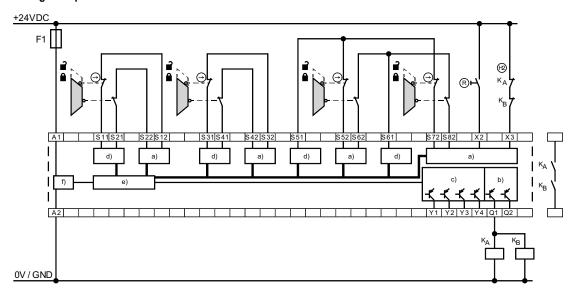

Dual-channel control, shown for a guard door monitor with two position switches where one has a positive break contact; with external reset button ®

- Relay outputs: Suitable for 2-channel control, for increase in capacity or number of contacts by means of contactors or relays with positive-guided contacts
- 🐵 = Feedback circuit

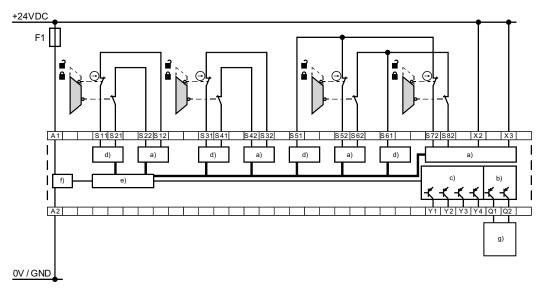

Signalling outputs must not be used in safety circuits.

## Wiring example SRB-E-204ST

# Wiring example SRB-E-204PE

#### Key

- a) Safety inputs
- b) Safety outputs
- c) Signalling outputs
- d) Clock outputs
- e) Processing
- f) Power
- g) Safety modules

Safe signal processing, e.g. by PROTECT SRB-E-series with start and reset functions as well as feedback circuit monitoring.

#### 7.3 Start configuration SRB-E-204ST

#### 7.3.1 Monitored start

 Manual start or activation of the module occurs when the button is released.

Monitoring of max. actuation time 0.03 s  $\dots$  3 s If the time is exceeded, the module cannot be started!

# 7.3.2 Reset without monitoring / autostart

- The manual start or the activation of the module occurs when the button is pressed (not when it is released!).
- With autostart, X2 must be bridged to +24 VDC

Not admitted without additional measure due to the risk of gaining access by stepping behind!

Within the meaning of EN 60204-1 paragraph 9.2.3.4.2 the operating mode "automatic start" is only restrictedly admissible. In particular, any inadvertent restart of the machine must be prevented by other suitable measures.

Reset button (detection of the trailing edge)	Reset without monitoring / autostart

Rotary knob position 3	Rotary knob position 8
Rotary knob position 4	Rotary knob position 9
Rotary knob position 5	Rotary knob position 10
Rotary knob position 11	Rotary knob position 12
Rotary knob position 13	Rotary knob position 14

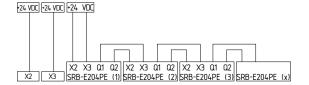

# 7.4 Feedback circuit SRB-E-204ST

 Suitable for increase in capacity or number of contacts by means of contactors or relays with positive-guided contacts. If the feedback circuit is not required, establish a bridge.

#### 7.5 Cascading SRB-E-204PE

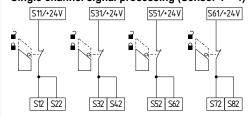

- Safety inputs X2 and X3 can be used for cascading of several SRB-E-204PE modules.
- Without cascading, inputs X2 and X3 must be bridged to +24 VDC.

## 7.6 Sensor configuration

- Different protective equipment can be monitored. See examples as follows
- · Sequence of protective equipment can be chosen freely
- Unrequired inputs S12, S22, S32, S42, S52, S62, S72, S82 must be bridged to outputs S11, S21, S31, S41, S51, S61.

6	Reset without monitoring / autostart

# 8. Set-up and maintenance

#### 8.1 Commissioning

The safety relay module features protection class IP54 for installation in a switch cabinet.

The safety relay module is delivered ready for operation. **Application 1** is preset in the factory.

#### 8.2 Functional testing

The safety function of the safety-monitoring module must be tested. The following conditions must be previously checked and met:

- 1. Correct fixing
- 2. Check the integrity of the cable entry and connections
- 3. Check the safety-monitoring module's enclosure for damage
- Check the electrical function of the connected sensor technology and their influence on the safety-monitoring module and the downstream actuators

The safety relay module features self-test functions. If a fault is detected, the system adopts a safe mode and leads, if necessary, to undelayed deactivation of all safety outputs.

# 8.3 Behaviour in the case of faults

In the event of a fault the following procedure is recommended:

- 1. Identify faults according to flash codes from chapter 6.2.
- 2. Rectify the fault if it is described in the table.
- 3. Switch operating voltage off and on and erase fault mode.  $\label{eq:control}$

If fault could not be rectified, please contact the manufacturer.

# Operating instructions Safety-monitoring module

# SRB-E-204ST / SRB-E-204PE

#### 8.4 Setting report

This report regarding the setting of the device must be completed accordingly by the customer and enclosed in the technical documentation of the machine.

The setting report must be available whenever a safety check is performed.

Company:			
The safety-monito	oring module is used in the	following machine:	
Machine n°	Machine type	Module n°	
Configured applic	eation (mode):		
Set on (date)	Signature of the resp	Signature of the responsible person	

# 8.5 Maintenance

A regular visual inspection and functional test, including the following steps, is recommended:

- 1. Check the correct fixing of the safety-monitoring module
- 2. Check the cable for damages
- 3. Check electrical function

If a manual functional check is necessary to detect a possible accumulation of faults, then this must take place during the intervals noted as follows:

- at least every month for PL e with category 3 or category 4 (according to EN ISO 13849-1) or SIL 3 with HFT (hardware fault tolerance) = 1 (according to EN 62061);
- at least every 12 months for PL d with category 3 (according to EN ISO 13849-1) or SIL 2 with HFT (hardware fault tolerance) = 1 (according to EN 62061).

Damaged or defective components must be replaced.

# 9. Disassembly and disposal

# 9.1 Disassembly

The safety-monitoring module must be disassembled in a de-energised condition only.

## 9.2 Disposal

The safety-monitoring module must be disposed of in an appropriate manner in accordance with the national prescriptions and legislations.

#### 10. Appendix

## 10.1 Wiring/circuit information

# Use of safety outputs Q1, Q2

Safety outputs Q1, Q2 are to be used for safety-orientated signal processing.

## SRB-E-204PE:

To realise additional safety functions, outputs Q1, Q2 can be evaluated with safety relay modules SRB or safety controllers.
